PRISM: The Governance-Native Agent Operating System

The first open-source agent platform with cryptographically enforced governance, tri-model cognitive orchestration, and full computer-use autonomy.

The False Dichotomy of Modern AI Agents

Every agentic framework today asks you to make the same trade-off. The result is platforms that are either too constrained to be useful or too unconstrained to be trusted. Guardrails bolted onto the side inevitably fail.

Safety as Load-Bearing Architecture

PRISM eliminates the power vs. safety trade-off. When governance is foundational, agents can be trusted with more autonomy, not less.

The Enterprise Reality Check

	Standard Frameworks	PRISM
Governance	Prompt-level guardrails, easily bypassed	Cryptographically enforced 10 Laws (SHA-256 integrity, CI-gated)
Multi-Model	Single model per request	Spectrum Refraction: tri-model parallel fan-out
Computer Use	Browser-only or terminal-only	Full-stack: Browser + Terminal + Container sandbox
Identity	API key auth	IAM with RBAC, SSO (OIDC/SAML), and Character Accountability Chains

Layer 1: Permanent Active Directives (PAD)

Layer 2: Spectrum Refraction Orchestration

Layer 3: LLRE Cognitive Economics

Unprecedented visibility into agent thinking.
Monitor token efficiency, context saturation, and
tool precision via SQLite persistence.

TEQ
(Token Efficacy
Quotient)

RSI

Index)

TCA
(Tool Call
Accuracy)

```
Prompt AST Compiler
```

```
<prompt_ast>
  <objective>
    Analyze market data and generate
    report.
  </objective>

  <constraints>
    <token_limit>4096</token_limit>
    <format>JSON</format>
  </constraints>
  <agent_plan>
    STEP 1: Fetch data (TCA: 99.1%)
    STEP 2: Process (TEQ: 94%)
    STEP 3: Output (RSI: 8.2)
  </agent_plan>
</prompt_ast>
```

Layer 4: Full Computer Use Environment

Browser Automation

Terminal Execution

Container Sandboxing

All execution pathways governed by the 3-tier policy engine. High-risk operations require explicit human approval.

SECURE CONTAINER ENCLOSURE

Layer 5: Multi-Agent Swarm Orchestration

Layer 6: Identity & Immutable Accountability

Character Accountability Control (CAC):

Every autonomous action is cryptographically linked to a human owner.
No orphan processes. No deniability.

The Extensibility Engine

Natively integrates 19+ built-in tools and the Model Context Protocol (MCP) marketplace. Hot-loading enabled without system restarts.

The Operator Console (localhost:7070)

Uncompromising Security Posture

100% self-hostable. Your data and API keys never touch the source tree.
CodeQL automated security analysis gated in CI.

From Chat Tools to Agents-as-a-Service (AaaS)

PRISM shifts AI from isolated chat tools to fully observable, autonomous workflows that respect operator constraints.
