

PRISM: Agents As A Service (AaaS)

Bridging state-of-the-art autonomous capabilities with cryptographically verifiable governance.

Intelligence without governance is a liability. PRISM proves that governed autonomy, causal observability, and adaptive execution yield superior real-world reliability.

The Governance Moat

The Capability Engine

The Enforcement Pipeline: Safety as Cryptographic Law

The PAD cannot be self-modified, overridden by prompts, or altered without explicit human governance council approval.

Character Accountability Control (CAC)

Profile-Aware Email Validation

Individual Profile	Business Profile
Permissive. Mixed-domain assignment allowed.	Strict Enforcement. Operator and Prism User domains MUST match. Rejected at assignment if mismatched.

Every mutating action generates an ActivityBus event, permanently stamped with this SHA-256 identity chain.

The 3-Tier Policy Engine

Key Concept

Timeout-as-Denial. In PRISM, unapproved high-risk operations automatically fall back to denial, preserving safety without hanging workflows.

Dual-Profile Operating Contract

Capability Surface	Individual Profile	Business Profile
Terminal Virtualization	✓	✓
Container Sandbox Lifecycle	✓	✓
Dynamic Tool Staging	✓	✓
Adapter / Plugin Pack Usage	✓	✓
Governance Enforcements (Divergent)		
Tier 2 Mutations	Rollback optional	🔒 Rollback strictly required
Tier 3 Bypasses	Whitelist bypass allowed	🔒 Bypasses permanently disabled
Audit Scope	High-risk logging only	🔒 100% operation lineage capture

PRISM Business is a superset of governance, not a subset of capability. Same intelligence, absolute enterprise control.

The Capability Engine: Sandboxed Full-Computer Use

Browser Automation

Playwright context isolation, session lifecycle handling, and persistent network/console capture for research workflows.

Terminal Virtualization

Persistent terminal channels, explicit lifecycle controls (start, exec, timeout, forced revoke), and environment injection policy metadata.

Container Orchestration

Sandbox lifecycle (create, start, snapshot, revert, destroy), strict resource quotas (CPU, Memory, Disk), and network isolation.

Enterprise-Grade Anti-Drift ☒

Sensitive actions enforce human confirmation, and all pathways feature built-in prompt-injection protections. 

Multi-Agent Swarm Topologies

Topology 1: Mesh

Peer-to-peer collaboration, consensus building.

Topology 2: Star

Divide-and-conquer, map-reduce delegation

Topology 3: Pipeline

Sequential multi-stage processing and refinement

Topology 4: Broadcast

Parallel evaluation and voting

Managed Agent Lifecycles

- Ephemeral (per-task)
- Semi-Permanent (promoted based on telemetry)
- Permanent (restored on boot)

Telemetry
auto-recommends
lifecycle promotions
based on swarm utility

Spectrum Refraction (SR) Architecture

Key Differentiator: Not sequential handoffs. Not simple concatenation. Simultaneous, parallel multi-model generation with structured, deliberate synthesis.

Spectrum Refraction: Instance Isolation Gates

Three Isolation Levels

PRISM validates hemisphere roles before execution, ensuring the Logic model meets reasoning thresholds and the Creative model supports vision/multimodal tasks.

The Operator Cockpit: Full Causal Observability

PRISM Dashboard

Tools & Plugins Matrix

Inventory: 19 built-in tools, 7 MCP plugins, 30 system utilities.

Network Command Console

Curated execution of 50+ network diagnostic commands, strictly governed by policy tier.

```
> traceroute ~/taceroute.zsmr
> ping -c 4 -/requestdiagnostis.com
> netstat -a
POLICY TIER: RESTRICTED
EXECUTION: PERMITTED
STATUS: SUCCESSFUL
>
```

Retrieval Observability

Cohort quality metrics, baseline-comparison deltas, and threshold-based alerts for memory utility and hit-rate drops.

LLM Audit Trail

Immutable tracking of provider/model switches, exportable to JSON/CSV for compliance officers.

TIMESTAMP	PROVIDER	MODEL	ACTION	STATUS
2024-05-20T14:38:00Z	Anthropic	Claude 3 Opus	SWITCH	CONFIRMED
2024-05-20T14:38:00Z	OpenAI	GPT-4	VALIDATE	CONFIRMED
2024-05-20T14:38:00Z	OpenAI	GPT-4	SWITCH	CONFIRMED
2024-05-20T14:38:00Z	OpenAI	GPT-4	VALIDATE	CONFIRMED

EXPORT JSON EXPORT CSV

The Trust-by-Design Lifecycle

Extreme intelligence and absolute governance co-existing without friction.
A continuous chain of custody from intent to impact.

Competitive Market Positioning

Capability	PRISM	OpenHands	Agent Zero	LangGraph	CrewAI
Multi-model parallel fan-out	Yes (L+R+Main)	No	No	No	No
Structured aggregation pipeline	Yes (XML-tagged)	No	No	No	No
Instance isolation enforcement	Yes (3-Tier Gate)	N/A	N/A	N/A	N/A
Constitutional governance	Yes (PAD+CAC)	No	No	Guards	Middleware
Multi-agent collaboration	Yes (4-topology)	Single	Hierarchy	Graph	Crews+Flows

ANALYST NOTE

While legacy frameworks rely on sequential tool-wrapping or graph edges, PRISM is the only platform delivering isolated, governed, parallel multi-model generation.

Measurable Trust: Operational SLAs

Aspirational safety is not enough; PRISM binds operational SLAs directly to the release pipeline.

Policy Decision Latency

Retrieval Latency

Event Propagation

Workflow Reliability

CI Release Validation

- ✓ Gate 9 (Directive Integrity) – Hash Validated
- ✓ Performance Qualification – Passing
- ✓ Profile Parity Tests – Equivalent

The enterprise AI transition requires more than just capable models. It demands verifiable control.

PRISM shifts the generative AI paradigm from informal chat tools to cryptographically governed, state-of-the-art autonomous operations. Intelligence, securely harnessed.
